

INTELLIGENCE FOR THE PHYSICAL WORLD

PHX Trust Layer

Existing PHX token capability is separate from locally implemented service credits and protocol designs. Intended utility spans notarisation/evidence credits, premium service access, usage-linked discounts, service bonds and provider assurance. Deployment and independent review are required for new protocol contracts.

PUBLIC EVIDENCE BRIEF / AS OF 2026-10-13

Problem

Service utility must be connected to actual use and bounded obligations.

Product

Notarisation/evidence credits, usage-linked discounts and proposed premium services/bonds/assurance.

Live state

Existing token capability; service credits and new protocol contracts implemented locally and not independently audited.

Customer evidence

No new protocol service-bond or validator assurance transaction claimed.

PRODUCT / EXPANSION / EVIDENCE

The path to scale.

Data moat

Verified use and single-use payment receipts support accounting; token ownership supplies no private access.

AI role

Assist service workflows; payment verification and authority remain deterministic.

Commercial model

Usage-linked service utility. No speculative appreciation, yield or stablecoin-backing promise.

Expansion path

Deploy only after service, security, merchant and legal scope are independently reviewed.

Demo and investor discussion

Briefing available; live utility demo pending. Contact: deck@raleplc.com

Evidence and provenance

PHX service-credit and protocol implementation | 2026-10-13 | Local implementation; new contracts unaudited and undeployed
